- parameters.
- Parametric EQ band.
- Output section with high and low pass filtering, width, balance and mix controls.
- Wide range of logically categorised presets.

Auto-clear is magical, it gives you the option to have enormous delay based effects that stop when you need them to, for example, when the next note hits. It's something you have to hear to really get your head around. Once you've used it you'll wonder how you ever used an echo without it.

Diffusion is an effect that smears the delay sound, taking it into the realm of a reverb, it's a way of knocking off some of the hard edges. Just like a reverb you can also adjust the size of the space and widen the stereo image.

Envelop Follow allows you to control how the delay evolves over time. You can have the delay time, feedback, and mix change over time with control over when that happens using ceiling and release time.

The Modulation section offers three distinct modes (Wobble, Stereo and Chorus) with slow and fast modulation control for classic tape emulation effects and more. It can create everything from big '80s guitars to bad tape machine effects and more.
