

Eventide Omnipressor 2830*Au 50th Anniversary Reissue

Eventide Audio has announced that the Eventide Omnipressor 2830*Au 50th anniversary reissue is now widely available both direct from Eventide and through dealers. The golden-anniversary Omnipressor Model 2830*Au, lovingly recreated from the original hand-drawn schematics from the Eventide archives, debuted at AES 2023. The golden anniversary reissue is a faithful replica designed with the same circuitry and the same sound as the original 2830. With supply chain issues resolved after 50 years, the 2830*Au is actually less expensive than the original at \$1999 in 2024 dollars, relative to the original price of \$600 in 1974 dollars. The new *Au model features the ability to link multiple units and is fitted with input and output audio transformers, which were a costly option in the original. Other improvements include a universal power supply and a back-lit meter. More convenient TRS/XLR connectors replace the original terminal strip.

In 1973, Eventide Clockworks introduced the Omnipressor, the first studio product to encourage the use of dynamics for special effects. It joined the Instant Phaser® in studios worldwide, with the Instant Flanger following shortly after. All were used on countless recordings and are now considered truly classic products. Unlike the Phaser and Flanger, the Omnipressor, with its still-unique dynamic reversal, infinite compression, variable gating and separate “side chain,” was discontinued a few years later. It had become difficult to obtain some exclusive parts and even more difficult to explain it to an industry that was much less sophisticated than it is today.

Mistake! As the few hundred original Omnipressor units found homes with rabid fans or suffered unspeakable fates at the hands of entropy, they became so scarce that the few that were available on resale markets multiplied in value many times, if they could be found at all.

The original Omnipressor was born from an idea that Eventide’s founder, Richard Factor, got while talking to Mark Weiss, one of the scientists investigating the “18-minute gap” of the Nixon Watergate scandal. The side-chain idea that resulted enabled feats of compression that were impossible (and unstable) with the compression architecture of the previous era, but doable with the emerging, more

modern hardware of the 1970s. The earlier “white face” (Model 2826) Omnipressor was not just hard to explain, it was hard to use, and it yielded shortly to the “black face” (Model 2830) unit designed by Jon Paul, another ex-colleague of Mark Weiss. This version, after selling another few hundred units, in its turn yielded to the darkness of commercial necessity – what we now call “supply chain” – and so became a legend to collectors and a desideratum to recordists worldwide.

In those few years of production, the model 2830 was a success! Engineers and producers discovered what was possible by using dynamics as an effect. Many of the original units are still in operation today. They rarely come up for sale; when they do sellers are asking north of \$6000! A clamor from those coveting the unique Omnipressor dynamic effects resulted first in Factor developing a hardware emulation using VSIG for the Eventide Orville, and later Eventide’s development team creating an Omnipressor plug-in for ProTools. Fatefully, in an episode of the Gear Club Podcast, Factor impulsively suggested that Eventide would reintroduce the rack mount classic.
