

Blustream NPA70DA

Leading AV distribution innovator Blustream today announced the availability of the new NPA70DA Dante Networked Power Amplifier. Featuring a 2 x 35W digital amplifier (1 x 70W mono) or 70V/100V hi-level constant voltage output and Dante audio integration, the NPA70DA networked audio zone amplifier delivers advanced audio integration within a commercial or residential AV installation. This is the second Dante-enabled amplifier from Blustream, following NPA100DA in May and expanding the company's portfolio of versatile amplifiers that can connect to both consumer and professional equipment.

"Whether integrators are working in the corporate market or completing a home audio project, distributing audio over a Dante-managed network is often becoming the best fit for design, budget, and performance expectations," said Martyn Shirley, Blustream General Manager. "The NPA70DA and NPA100DA can be used to overcome a number of challenges presented in remote installations."

The Blustream NPA70DA can be powered via PoE++ from a compatible network switch or locally should the switch not support PoE++. The unit also includes the ability to lower the amplifier power output subject to PoE capabilities, support for combined or independent LAN and Dante connections, DSP with a 31 band EQ, audio delay for lip sync correction, and control via front panel, IR, RS-232, TCP/IP, web-GUI or 12V trigger.
